# An horizontal IoT environment for unmanned barge digitalisation

Claudio Salvadori – NGS

[Claudio.salvadori@ngs-sensors.it](mailto:Claudio.salvadori@ngs-sensors.it)

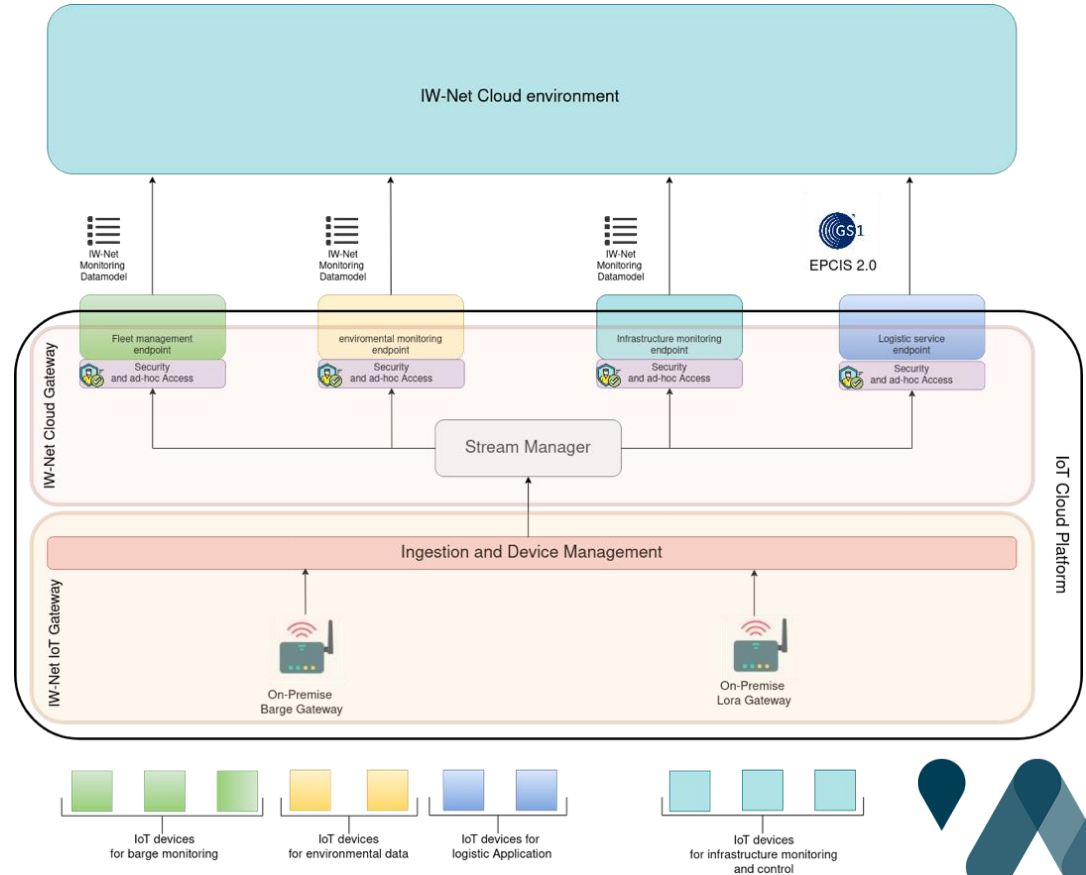

---

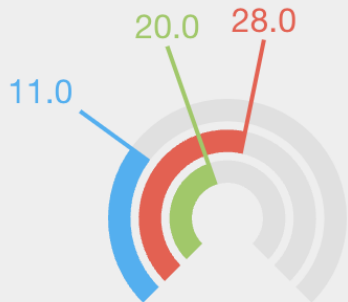

## Objective

- Instantiate a horizontal and agnostic IoT environment to serve various services:
  - Logistics Tracking, Tracing and Monitoring (discussed in AS1)
  - Assets (reusable assets, e.g., pallets, boxes, etc.) and/or fleet management (barges, etc.)
  - Barge monitoring (unmanned)
  - Environmental monitoring

# Gateway approach

TEMPERATURE

HUMIDITY

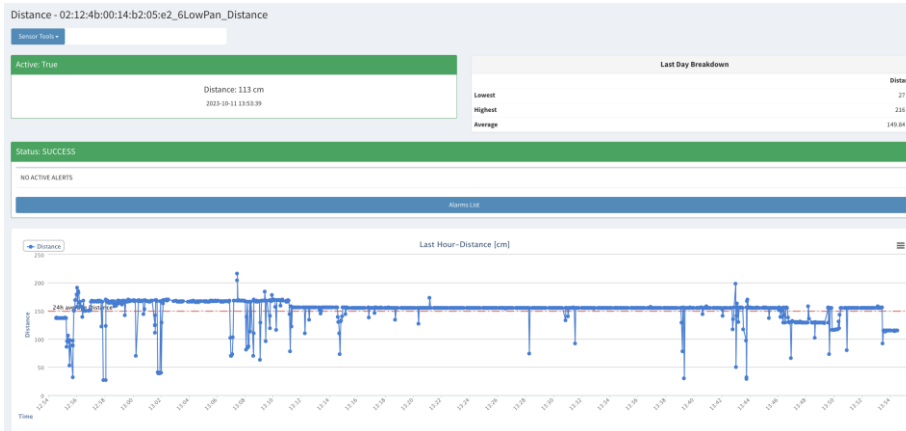

# Fleet management

- Position of barges and of assets
- Overview of the monitored parameters
- Overview of the status of the devices (e.g., battery)
- APIs (based on GS1 EPCIS 2.0)
- GUI

# Monitoring on the barges

Different sensors for different purposes

- Barge monitoring
  - Vibration
  - Water level
  - Engine temperature
- Environmental monitoring
  - Water temperature
  - Environmental gas monitoring

APIs and GUI

## And the story continues...

- OHB and NGS are developing joint projects: Decarbomile (GA 101069806)
- Objectives:
  - Automitise the barge functions (monitoring)
  - Improve the logistics services (smart boxes)
  - Implement new automatic services: load balancing and optimised loading
